Neural Networks

Multi-layer Perceptron [Hopfield, 1982]

- Useful for classifying **non-linear data boundaries** - non-linear class separation can be realized given enough data.

Neural Networks

Types of Non-linearities ϕ

tanh

sigmoid

ReLu

Cost-Function

Mean Square Error

$$J_{MSE} = \sum_{i=1}^M ||\mathbf{v}_i - \mathbf{y}_i||^2$$

Cross Entropy

$$J_{CE} = - \sum_{i=1}^M \mathbf{y}_i^T \log(\mathbf{v}_i)$$

$\mathbf{y}_i$ are the desired outputs

Learning Posterior Probabilities with NNs

Neural networks **predict posterior probabilities** [Richard, 1991]

$$P(C_i|\mathbf{X}) = \frac{p(\mathbf{X}|C_i)p(C_i)}{p(\mathbf{X})}$$

When DNNs are trained with CE or MSE

$$\mathbf{v}(\mathbf{x}) = \mathcal{E}_{y|\mathbf{X}=\mathbf{x}}[\mathbf{y}]$$

Neural networks **estimate conditional expectation of the desired targets** given the input

When the targets are discrete classes $\mathbf{y} = [0 \ 0 \ .0 \ 1 \ 0 \ .0]$
conditional expectation is the class posterior !

Learning Posterior Probabilities with NNs

Choice of target function ψ

- Softmax function for classification

$$\psi(v_i) = \frac{e^{v_i}}{\sum_i e^{v_i}}$$

- Softmax produces positive values that sum to 1
- Allows the interpretation of outputs as posterior probabilities

Parameter Learning

$$\mathbf{v}^2 = \psi \left(\mathbf{W}^2 \phi(\mathbf{W}^1 \mathbf{x} + \mathbf{b}^1) + \mathbf{b}^2 \right)$$

Error function for entire data

$$J_{MSE} = \sum_{i=1}^M ||\mathbf{v}_i - \mathbf{y}_i||^2$$

Typical Error Surface as a function of parameters (weights and biases)

Parameter Learning

Error surface close to a local optima

Non-linear nature of error function

- Move in the reverse direction of the gradient

$$\mathbf{W}_1^t = \mathbf{W}_1^{t-1} - \eta \frac{\partial J}{\partial \mathbf{W}_1}$$

Error back propagation

$$\frac{\partial J}{\partial \mathbf{W}_1} = \frac{\partial J}{\partial \psi} \times \frac{\partial \psi}{\partial \phi} \times \frac{\partial \phi}{\partial \mathbf{W}_1}$$

Summary so far...

- Neural networks as discriminative classifiers
- Need for hidden layer
- Choice of non-linearities and target functions
- Estimating posterior probabilities with NNs
- Parameter learning with back propagation.

Need For Deep Networks

Modeling complex real world data like speech, image, text

- Single hidden layer networks are too restrictive.
- Needs large number of units in the hidden layer and trained with large amounts of data.
- Not generalizable enough.

Networks with multiple hidden layers - deep networks

(Open questions till 2005)

- Are these networks trainable ?
- How can we initialize such networks ?
- Will these generalize well or over train ?

Deep Networks Intuition

Neural networks with multiple hidden layers - Deep networks [Hinton, 2006]

Deep Networks Intuition

Neural networks with multiple hidden layers - Deep networks

Deep Networks Intuition

Neural networks with multiple hidden layers - Deep networks

Deep networks perform **hierarchical data abstractions** which enable the non-linear separation of complex data samples.

Summary so far...

- Linear models to neural network.
- **Deep Neural networks** as extensions of NNs.
- Intuition behind multiple hidden layers

Deep Networks

- Will the networks **generalize** with deep networks
 - DNNs are **quite data hungry** and performance improves by increasing the data.
 - Generalization problem is tackled by **providing training data from all possible conditions**.
 - Many artificial data augmentation methods have been successfully deployed
 - Providing the **state-of-art performance in several real world applications**.

Representation Learning in Deep Networks

- The input data representation is one of most important components of any machine learning system.

Cartesian Coordinates

Polar Coordinates

Representation Learning in Deep Networks

- The input data representation is one of most important components of any machine learning system.
 - Extract factors that enable classification while suppressing factors which are susceptible to noise.
- Finding the right representation for real world applications - substantially challenging.
 - Deep learning solution - **build complex representations from simpler representations.**
 - The dependencies between these hierarchical representations are refined by the target.

Representation Learning in Deep Networks

[Zeiler, 2014]
